Nuclear Safety

Module 3

DEFENSE IN DEPTH

Slide 1

Rescusa03.pp

Defense in Depth

The principle that multiple, redundant nuclear safety provisions are required to protect workers, the public and the environment from the radiological hazards of NPP operations.

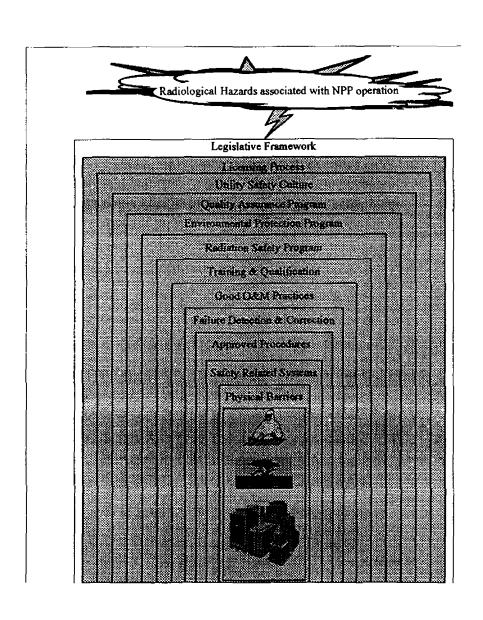

Slide 2

Assumptions Inherent in Defense in Depth Safety Philosophy

- 1. People make mistakes
- 2. Design isn't perfect
- 3. Equipment fails

Slide 3

Safety Culture Model

- 1) Accident prevention
- 2) Accident mitigation
- 3) Accident management

Slide 5

1) Accident prevention

- quality design, procurement, construction, operations and maintenance for reliable systems
- faults detected and corrected promptly
- when systems fail, upsets prevented from escalating
 - » automatic system response
 - » unit placed in safe state by well-trained staff using approved procedures
- standby safety support systems

Slide 6

2) Accident mitigation

- shut down, cool, contain (via special safety systems, for serious process failures)
- AIM procedures executed by trained staff

Slide 7

3) Accident accommodation

- emergency response procedures executed by trained staff
- public notifications and protective measures
 » eg, banning food & water, sheltering,
 evacuation, KI pills
- Province, Municipalities and Federal Govt.
 respond per Nuclear Emergency Plans

Slide 8

Maintenance on Safety Related Systems

- O&M activities on safety related systems can impair or remove a layer of defense
- Then countermeasures are required to compensate for the increased risk
 - <u>Example 1</u>: Quiet mode operation to reduce probability of upset
 - <u>Example 2</u>: Synchronizing SG to class 3 bus to increase reliability
 - Example 3: Dedicated Operator when placing one liquid zone on manual control

Slide 9

Why Use Approved Procedures?

- Extra layers of defense provided
- Technical and Operational reviews ensure that:
 - potential effects on other systems have been considered
 - barriers to releasing radioactivity are not compromised
 - procedures addressing system failures really do put unit into a safe state

Slide 10

Defense in Depth in Event Diagnosis

- Operator training (classroom, field, simulator, co-piloting)
- Diagnostic aids (eg, CSP display, PRAG)
- Independent diagnosis by SOS and SS
- Monitoring critical safety parameters during recovery to ensure that unit is responding predictably, consistent with diagnosis

Slide 11

Placing an Automated Control System on Manual Control

- Observe similar constraints as designed into automated system
- Dedicate an Operator where appropriate, to simulate the 'undistracted' operation of the automatic controller--eg, controlling one liquid zone level

Slide 12

Rescse03.ppt

Role of Training & Qualification in Defense in Depth

Equips staff to:

- recognize when a layer of defense is jeopardized
- perform critical O&M activities safely--eg,
 - Instrument calibration
 - Safety system testing
 - Panel checks
- identify equipment failures at incipient stage
- execute emergency procedures safely

Slide 13

The 5 Barriers between Fission Products and the Public

- 1. Ceramic fuel
- 2. Fuel sheath
- 3. HTS boundary
- 4. Containment
- 5. Exclusion zone

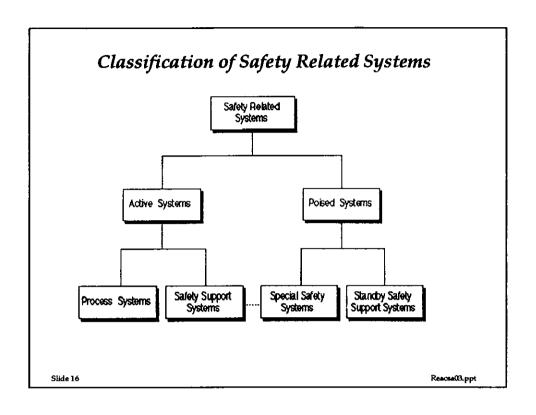

Slide 14

Rescus03.ppt

Impact of Large Scale Fuel Failures on the Five Physical Barriers

- At least 2 barriers breached (ceramic and sheath)
- In event of a LOCA, third barrier (HTS boundary) also breached
- In event of a dual failure, fourth barrier (Containment) also breached

Slide 15

Examples of Active and Passive Systems

	Process System	Safety Support System	Special Safety System	Standby Safety Support System
٠	PHT	Electrical power	• SDS1	Steam Gen./Boiler Emergency Cooling
٠	Mod. Aux.	 Process water 	• SDS2	Standby generators
		Instrument air	• ECI	Containment venting
		Backup heat sinks	Containment	Setback and stepback
		Secondary control area		Emergency water
1		Annulus gas	1	Emergency power
		• PHT		Secondary control areas
L		Moderator		Backup heat sinks
